背包界面设计

一: CocoStudio设计

二:数据设计

三: 代码设计

www.neworigin.net

一: CocoStudio设计

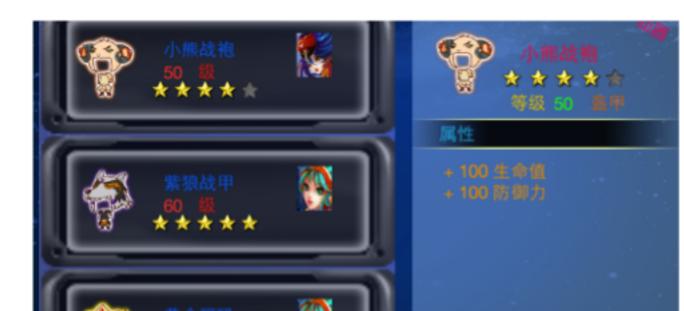

在游戏里面,我们经常会遇到装备背包界面,里面的元素有的是一行一行的,有的是一行里面有多个,不管怎么设计,大体都会遵循一个思路,就是ListView里面存放每一个单元格,单元格里面控制具体元素的布局。

下面我们从CocoStudio的角度来进行背包界面的设计。

版本说明: quick3.5 final搭配CocoStudio2.2.1, 其他的版本会出现错误。

步骤如下

- (1) 新建一个CocoStudio工程,命名为PackageDemo,同时倒入我们上课提供的图片资源。
- (2) 新建一个层,命名为EQCell,同时大小设置为400*150, 为了匹配ListView的大小。
- (3) 根据项目的UI要求,添加ImageView,Text等控件,并且进行规范的命名。图片如下所示:

页码: 2/3

www.neworigin.net

- (4) 新建一个PackageLayer, 用来进行ListView以及右侧详细界面的布局,这里主要有两个元素, ListView以及基础Panel,右侧的具体信息全部布局在基础面板之上,之后我们获得子节点的同时就需要根据这个来获取。在此注意每个控件的命名,之后我们要使用它。
- (5) 设计完成之后,发布资源,并且将其拖动我们项目的res 文件夹下。注:这里我们采用真实目录

二:数据设计

游戏的数据无非就是几种格式,xml,json,execl,csv,table等,在Cocos里面我们经常使用json,在lua里面我们最常用的就是table,将一些基础的装备信息存放在table里面,当我们使用的时候,通过table数据的获取方法,很简单的就能取得数据。我们在此使用的数据结构如下所示local EDData = {

- [1] = {name = "小熊战袍",kind="仙器",eq_kind ="盔甲",lv =50,star =4 ,hero =1,add = {health = 100 ,atk =0 ,def =100 }},
 [2] = {name = "紫狼战甲",kind="绝世",eq_kind ="盔甲" ,lv =60 ,star =5 ,hero =2 ,add = {health = 200 ,atk =100 ,def = 200 }},
- [3] = ${name = "黄金狮吼", kind="绝世", eq_kind = "盔甲", lv = 60, star = 5, hero = 2, add = <math>{health = 200, atk = 100, def = 200}$ },

[4] = {name = "黄金圣衣".kind="绝世".eq kind ="亥田".lv

```
[4] = {name = "黄金圣衣",kind="绝世",eq_kind ="盔甲",lv = 60 ,star = 5 ,hero = 3 ,add = {health = 200 ,atk = 100 ,def = 200 }},

[5] = {name = "龙骑战衣",kind="仙器",eq_kind = "盔甲",lv = 50,star = 4 ,hero = 1,add = {health = 100 ,atk = 0 ,def = 100 }},

[6] = {name = "木簪",kind="凡器" ,eq_kind = "头饰" ,lv = 1 ,star = 0 ,hero = 0,add = {health = 50 ,atk = 0 ,def = 50 }},

[7] = {name = "金霞棒",kind="名器" ,eq_kind = "武器" ,lv = 1,star = 2,hero = 0,add = {health = 0 ,atk = 100,def = 0}},
```

页码: 3/4

```
www.neworigin.net
```

```
=2 ,star =3 ,hero =0 ,add = {health =100 ,atk =100 ,def =0 }},

[9] = {name = "金手臂",kind="名器" ,eq_kind ="护腕" ,lv = 3,star =3 ,hero =0 ,add = {health =100 ,atk =0 ,def =0 }},

[10] = {name = "紫凤霞衣",kind="仙器",eq_kind ="盔甲",lv = 70,star = 3,hero =0 ,add = {health =100 ,atk =0 ,def =100 }},
```

[8] = {name = "玄奘法杖",kind="仙器",eq_kind ="武器",lv

三: 代码设计

(1) 我们首先需要创建ListView每一个选项对应的cell, 创建代码如下所示,主要就是一个class,继承自 ccui.Widget,这样我们才能正确的添加进入ListView。创建 代码如下所示:

```
local EQCell = class("EQCell", function()
    return ccui.Widget:create()
end)

function EQCell:ctor(eq_id)
  self.id = eq_id
  self.cell = cc.uiloader:load("EQCell.csb")
  self:addChild(self.cell)
  self:setContentSize(self.cell:getContentSize())
  self:initUI()
```

```
end
```

```
function EQCell:initUI()
  self.icon = self.cell:getChildByName("img_icon")
  self.lb_lv = self.cell:getChildByName("lb_lv")
  self.lb_name = self.cell:getChildByName("lb_name")
  self.star = {}
  for i=1,5 do
    self.star[i] = self.cell:getChildByName("star_"..i)
  end
    self.hero = self.cell:getChildByName("img_hero")

self:refreshUI()
```

页码: 4/5

www.neworigin.net

end

```
function EQCell:refreshUI()
  local data = EQData[self.id]
  self.icon:loadTexture("eq_"..self.id..".png")
  if data.hero ~= 0 then
        local hero_img = "hero_"..data.hero..".jpg"

print(hero_img)
        self.hero:loadTexture(hero_img)
  end

self.lb_lv:setString(tostring(data.lv))
  self.lb_name:setString(data.name)
  for i=1,data.star do
        self.star[i]:loadTexture("star_on.png")
  end
end
```

综合上述代码,主要思想就是创建一个id,用来标识每一个cell,然后根据id从table里面读取对应的元素,进行界面的展示即可。

(2) 详细信息界面的代码设计

此界面更求我们占土单元权的时候 能够从甲面兹取

www.neworigin.net

```
self.btn_lv_up = self.eqdes:getChildByName("btn_up")
self.btn_star_up = self.eqdes:getChildByName("btn_star_up")
self.eqdes_icon = self.eqdes:getChildByName("des_icon")
self.eqdes_kind = self.eqdes:getChildByName("des_kind")
 self.star = {}
 for i=1.5 do
      self.star[i] = self.eqdes:getChildByName("star_"..i)
 end
self.eqdes_name = self.eqdes:getChildByName("des_name")
self.lb_kind = self.eqdes:getChildByName("lb_kind")
self.lb_lv = self.eqdes:getChildByName("lb_lv")
self.lb_des = self.eqdes:getChildByName("lb_des")
 self:refreshListView()
end
function MainScene:refreshListView()
 self.cell = {}
 for i=1,#EOData do
      self.cell[i] = E0Cell.new(i)
      self.listView:pushBackCustomItem(self.cell[i])
      self.cell[i]:setTouchEnabled(true)
```

```
self.listView:addEventListener(
           function ( sender, event)
           print("*****************************
           if event==1 then
                dump(event)
self.selected_index=sender:getCurSelectedIndex()
                 print(self.selected_index)
                 self:refreshDes()
           end
           end)
 end
 self:refreshDes()
end
function MainScene: refreshDes()
 local item = self.listView:getItem(self.selected_index)
 local data = EQData[item.id]
 self.eqdes_icon:loadTexture("eq_"..item.id..".png")
 self.eqdes_kind:setString(data.kind)
 self.eqdes_name:setString(data.name)
                           页码: 6/7
```

www.neworigin.net

```
self.lb_kind:setString(data.eq_kind)
self.lb_lv:setString(tostring(data.lv))
local lb_des = ""
if data.add.health ~=0 then
     lb_des = lb_des.."+ "..data.add.health.." 生命值\r\n"
end
if data.add.atk ~=0 then
lb_des = lb_des.."+ "..data.add.atk.." 攻击力\r\n"
end
if data.add.def ~=0 then
     lb_des = lb_des.."+ "..data.add.def.." 防御力\r\n"
end
self.lb_des:setString(lb_des)
for i=1,data.star do
     self.star[i]:loadTexture("star_on.png")
end
for i=data.star+1,5 do
```
